

Analysis

HTTP 1.1 Persistent

HTTP 1.1 also allows you to have persistent connections which means that you can have more than one request/response on the same HTTP connection.

HTTP 1.0 Persistent

In HTTP 1.0 you had to open a new connection for each request/response pair. And after each response the connection would be closed. This lead to some big efficiency problems because of TCP slow start.

Analysis: HTTP version 1.1 is better then 1.0 when we have many request (i.e 100) done at a same time but when we perform less requests then 1.0 is better because it consumes less time.

Reason: When we do many request on server then in 1.0 it make connection on every request it is good for less request. When we do request on server then 1.1 open connection for every request so it consumes less time.
